- Digital Trunked Wide Area IP Networks
- FM Conventional & LTR® Trunking

# NEXEDGE™: Multiple Solutions – One System

All NEXEDGE™ products use advanced DSP-driven digital voice technologies and support both FM analog and new digital fleets. System type conversion or expansion only requires software options and/or additional base station units, i.e., no “major” upgrading. Kenwood offers NEXEDGE™ conventional, conventional IP networks, trunked and wide area trunked IP networks solutions with secure digital voice and an array of advanced digital feature sets for business and government sectors.

## NXDN® Digital Air Interface

NEXEDGE™ is powered by the NXDN® digital air interface, an FDMA digital access methodology generated with optimized DSP coding, AMBE+2™ voice coding technology, unique filtering and a 4-level FSK modulation technique producing an industry-leading low bit error rate (BER) digital performance even at weak RF signal strengths.

- **Natural Sounding Digital Voice** The AMBE+2™ VOCODER, a state-of-the-art voice digitization technology, replicates an individual's natural human speech nuances accurately unlike early technologies that sounded unnatural and synthesized. The AMBE+2™ offers superior voice quality at varying signal strengths even at highway speeds.
- **Extended Range over FM** As RF signal strength weakens with distance, FM analog reception becomes increasingly noisy and intermittent. NXDN®'s low BER improves reception in fringe areas, thereby increasing the effective range by as much as twenty percent over analog FM.
- **Large Group & Individual ID Capacity**  
The NXDN® subscriber air interface protocol supports 65,519 GIDs & 65,519 UIDs for system sharing and large organizations (maximum IDs available depend on operational mode). IDs can be organized by agencies, divisions, departments and individuals.
- **Spectrum Efficient Now** The NXDN® digital air interface and equipment are capable of all channel bandwidths.
  - FM Analog @ 25 & 12.5 kHz Channels
  - NXDN® Digital @ 12.5 & 6.25 kHz Channels

## Digital Common Features

NEXEDGE™ supports common call features in both digital conventional and trunked modes.

- **Over-the-Air Alias** A calling unit's UID alphanumeric alias is sent over the air and displayed on a receiving unit's LCD, so there is no need to program every fleet alias in every radio.
- **Paging Call** Up to five UID unit-to-unit pages are dated, time-stamped and stored for recall and review – useful for unattended radio messages and non-voice selective paging operations.
- **Emergency Call** Subscriber units can declare an Emergency to a console, an individual, a group or all groups. This signal can be triggered by a manual key, a footswitch (mobiles) or man-down tilt-switch (portables).
- **Remote Stun/Kill** Enables a dispatcher to temporarily or permanently disable a lost, stolen or compromised radio unit over the air for system security and personnel safety.
- **Remote Check** Enables a dispatcher to check if a unit is on or in range.
- **All Group Call** A selectable All Call GID calls all talk groups on the system for facility wide announcements, emergencies and evacuation scenarios.

## Digital Conventional Mode

NEXEDGE™ conventional systems offer extended system sharing conventional systems. Also both FM analog & digital units can share the same NEXEDGE™ RF channel!

- **RAN (Radio Access Number)** NEXEDGE™ base units include a 16 RAN capacity conventional repeater controller for 16 user group site sharing [RAN range: 64 (1-63+None) ; analogous to CTCSS/DCS use in FM].

- **65,519 GIDs** Large talk group ID capacity for group selective calling.
- **65,519 UIDs** Large unit ID capacity for individual selective calling.
- **Mixed Channel Type** FM & NXDN® conventional units can share the same RF channel. Both subscriber units and bases demodulate incoming analog FM or NXDN® digital calls and talkback or repeat the same mode (conventional channels only; must use 12.5 kHz narrow bandwidth).

## Conventional IP Networks

NEXEDGE™ Conventional IP links up to 16 or 48 digital conventional repeaters\* into one system for wide area coverage or coverage fill-in extensions. As users roam

throughout the network the subscriber units use the beacon signals and to choose the best repeater for communications.

\* Version 2.0 or later and certain routing type required [16 (unicast) / 48 (multicast)] for maximum number of repeaters per network.

## Digital Trunking Mode

NEXEDGE™ trunking provides increased capacity, enhanced call capabilities, improved security and faster communications with less user operation than conventional systems require.

- **Fast System Access** Channels selection is automatic and no user monitoring is required.
- **Enhanced Efficiency** Users share a pool of channels per site and thereby experience less busies during peak hours. .
- **30 Channels @ Site** NEXEDGE™ sites can be operated as single-channel sites to take advantage of the trunking feature sets or as many as 30 channels for full trunked efficiency.
- **Message Trunked** Users are granted a traffic channel for the length of a two-way call thereby reducing interruptions (utilizes more system resources).
- **Transmission Trunked** Users are granted a traffic channel only during each push-to-talk, thus optimizing channel resources during peak traffic hours.
- **3,000 GIDs @ Site** Large talk group capacity for fleet dispatch operations.
- **3,000 UIDs @ Site** Large unit ID capacity for private unit-to-unit calling.
- **Call Queuing** Automatically stacks call requests when the system is busy and processes calls when a channel becomes available.

\* Pre-emption will soft terminate a lower priority call and allocate the traffic channel for very important personnel, dispatchers or emergency calls.

- **8 Priority Levels with Pre-emption** Processes the call queue in order of priority. Pre-emption allocates a talk path for priority personnel, dispatch and emergency calls.
- **4 Priority Monitor IDs** Automatically switches radios to a higher priority call such as a dispatcher or supervisor, even when on a low priority call.
- **Late Entry** Permits subscriber units to join a call already in progress after powering on or entering system coverage.
- **Broadcast Call** Calls all fleets or all units in a fleet for emergencies and incident response scenarios.
- **Remote Group Add** Adds a new GID to subscriber units remotely over-the-air to form a workgroup for emergencies, special events, operations or incidents (available in multi-site release).
- **Failsoft Mode** If trunking capability is disabled, the system reverts to conventional operation so basic communications can continue.
- **ESN Validation** Each subscriber unit has a unique factory-embedded ESN validated by the system to protect against unauthorized access.
- **Control/Traffic Channel Switching** Designates a Traffic Channel as a new Control Channel should the original become disabled. Disabled Traffic Channels are automatically removed from service.

## Multi-Site Trunked IP Networks

The network option leverages the power of IP to link NEXEDGE™ digital trunked sites together for wide area call capabilities.

- **16 or 48 Digital Trunked Site Networks\*** Multiple trunked sites can be linked together as one network for campus, citywide, countywide, regional or inter-state communications.
- **LAN/WAN Connectivity** Scalable networks can be created over existing IT assets, private microwave, spread-spectrum links or carrier services using standard 10/100 Base-T Ethernet switches and routers. IPSEC VPN tunneling provides encryption and authentication for secure communications links within any IP networks.

- **60,000 GIDs & 60,000 UIDs @ Network** Large subscriber capacity for shared networks and large fleets.
- **Automatic Roaming** Subscriber units automatically search for the best accessible sites while moving throughout a network. Subscriber units use advanced control channel hunting algorithms and RF signal strength (RSSI) monitoring to make accurate and prudent roaming and registration decisions.

\* Version 2.0 or later and certain type routing required [16 (unicast) / 48 (multicast)] for maximum number of sites per network and inter-site.

## ● Multi-Mode Flexibility/Migration Guaranteed

**NEXEDGE™ equipment supports analog FM and NXDN® digital modes providing operators a self-paced migration path from analog to fully digital.**

- **All Mode Capable** All NEXEDGE™ subscriber equipment includes analog conventional, analog LTR® trunked, NEXEDGE™ conventional and trunked digital modes. All NEXEDGE™ base /repeater units include analog conventional, NEXEDGE™ conventional and upgrade to NEXEDGE™ Trunked & Multi-Site capability.

- **NXDN® Traffic Channel Sharing** “Shared” repeater operation allows NXDN® trunked Traffic Channels to be shared with analog Conventional channels or with analog LTR® trunked logic providing a migration path from analog to all digital fleets.
- **High-power Coverage** NEXEDGE™ systems use analog FM power amps and site management equipment for both analog FM and NXDN® digital modes saving on migration or build out costs while retaining a large coverage system footprint.

## ● Secure Voice

**NEXEDGE™ offers voice security that enhances personnel safety, reduces risk exposure and thwarts competitive breeches by protecting sensitive communications for your facilities and operations.**

- **Inherent Level of Security** The NXDN® digital air interface itself prevents casual eavesdropping.
- **FM & NXDN® Voice Security Options** Protects against more sophisticated eavesdropping.

## ● Integrated Data Services

**NEXEDGE™ includes unit ID, emergency, GPS location, status and messaging capabilities in both FM and NXDN® digital modes.**

- **Fleet Management & Location**
- **Messaging & Data**
- **Emergency**

## ● System Management

**The NEXEDGE™ KPG-110SM System Manager reduces operational and maintenance costs with remote programming, firmware uploading privileging, monitoring & diagnostics capability from an operator-friendly secure Windows® application (for NXDN® Trunked sites and networks only).**

- **Secure Access** USB encrypted hardware keys limit System Manager and site access to authorized personnel only.
- **System Parameters** Operators are provided with full site and network configuration control by remote connection. Sites can be accessed directly on-site or through dialup modem or IP connection.
- **Subscriber Privileging** UID/GID validation, 127 UID/127 GID Class-of-Service entries and 5000 Fleet UID/GID lists permit operators to grant certain access privileges, call types, Inter-site Call capabilities and queue priority for all group and individuals on a system.

- **Real-Time Activity Monitoring** All sites traffic can be monitored real time for management and troubleshooting purposes.
- **Call Logs** Operators can download detailed call activity of any channel, site, individual or group for traffic, security and incident analysis.
- **Channel Loading** Graphs peak usage and blocking statistics to identify possible system traffic / capacity issues.
- **NXR Diagnostics** Operators can remotely monitor each NXR units' hardware and Ethernet network interface to identify possible problems at any site.
- **NXR Firmware Uploading** Operators can remotely update operational firmware in all NXR units without ever having to drive to a site.
